Jitter Measurement

Conclusions

Presentation Outline

- Introduction
- Phase Noise
- Jitter
- Jitter Measurement
- Conclusions

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Introduction

- Difference between phase noise and jitter
- Origin of phase noise
- Relation between phase noise and jitter
- Jitter measurement in data acquisition systems

Phase Noise

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Outline

- What is Phase Noise
- Why it is important
- Where does it come from
- How do we specify it

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

What is Phase Noise

$$v(t) = A \cdot \cos[2\pi \cdot f_c \cdot t + \varphi(t)]$$

- φ accounts for deviations in phase and in frequency from its nominal value of f_c

Introduction

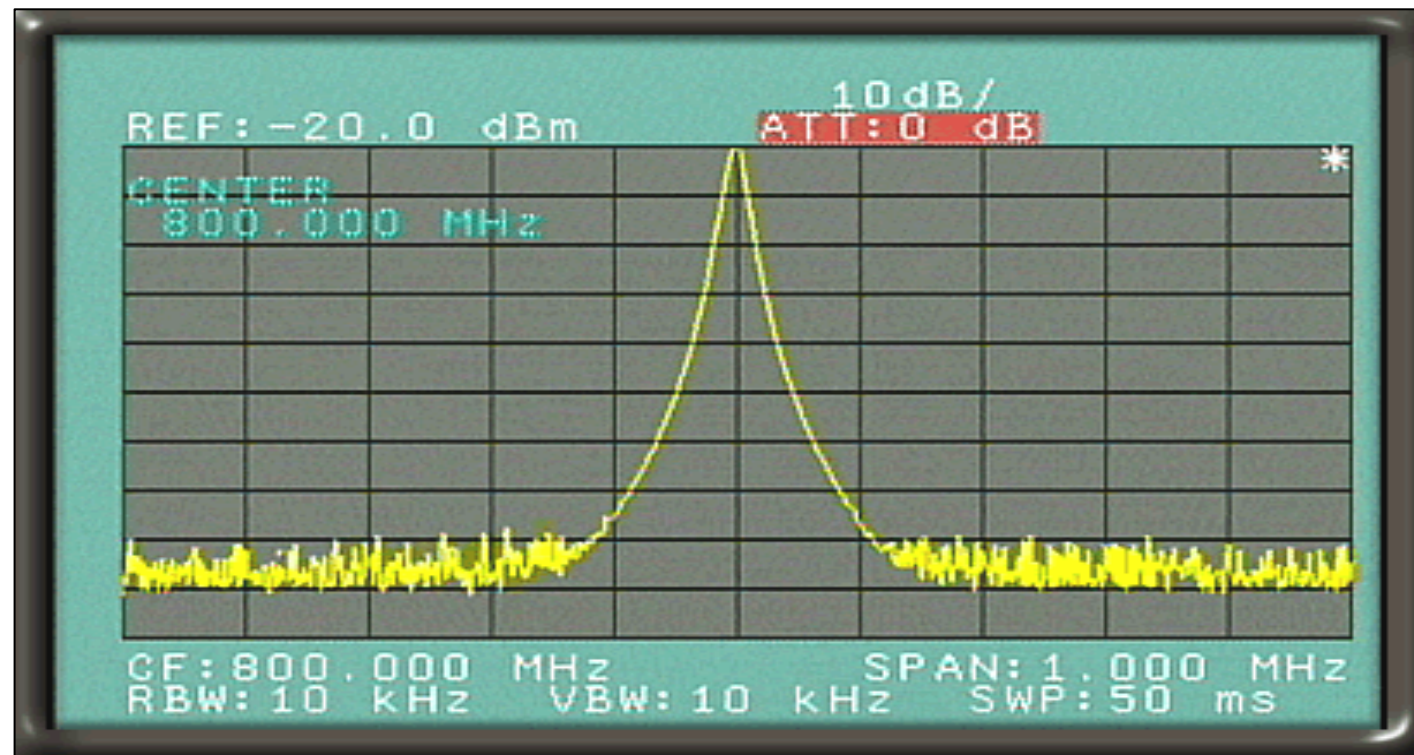

Phase Noise

Jitter

Jitter Measurement

Conclusions

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Power Spectral Density

$$v(t) = A \cdot \sin[2\pi \cdot f_c \cdot t + \varphi(t)]$$

$$v(t) \approx A \cdot \sin(2\pi \cdot f_c \cdot t) + A \cdot \varphi(t) \cdot \cos(2\pi \cdot f_c \cdot t)$$

$$S_v(f) = \frac{1}{T} |\mathcal{F}\{v(t)\}|^2 \quad S_\varphi(f) = \frac{1}{T} |\mathcal{F}\{\varphi(t)\}|^2$$

$$S_v(f) = \frac{A^2}{4} [\delta(f - f_c) + \delta(f + f_c)] + \frac{A^2}{4} [S_\varphi(f - f_c) + S_\varphi(f + f_c)]$$

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Power Spectral Density

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Sine wave Power

$$P = \frac{1}{T} \int_0^T v^2(t) \cdot dt$$

$$P = \int_{-\infty}^{\infty} S(f) \cdot df$$

$$P = \frac{A^2}{2}$$

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Phase Noise Spectrum

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Phase Noise Spectrum Units

$$\mathcal{L}(f) = 10 \cdot \log \left[\frac{1}{2} S_{\varphi}(f) \right]$$

- S_{φ} is expressed in rad^2/Hz
- \mathcal{L} is expressed in dBc/Hz
 - Note that **Hz** in this case refers to the argument of the logarithm

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Typical Phase Noise Spectrum

© Analog Devices

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Why it is Important

© Analog Devices

- The presence of Phase Noise can mask important signals.

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Why it is Important

- Increase in Phase Noise degrades SNR

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Where Does it Come From?

- Different Types of Oscillators
 - Resonator based (feedback)
 - Relaxation
 - Ring Oscillators

Phase Noise

Resonator Based Oscillator

Introduction

Phase Noise

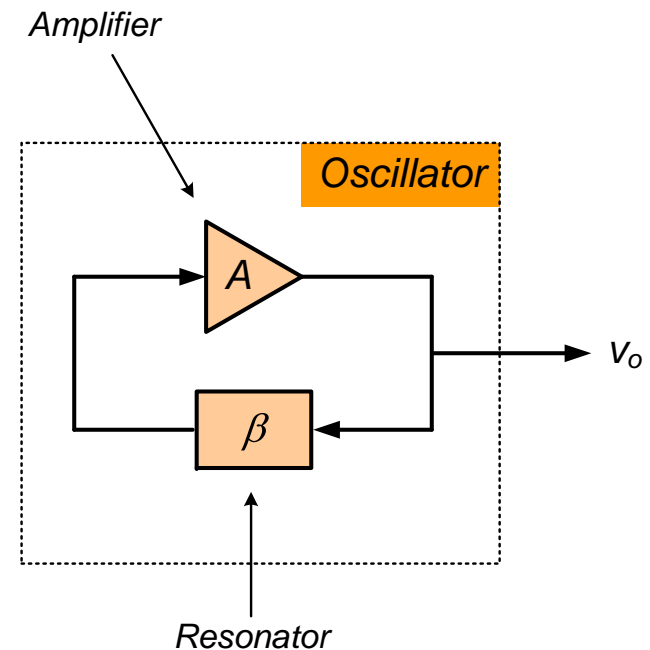

Jitter

Jitter Measurement

Conclusions

Resonator Based Oscillator

- Feedback loop
- Active element A
- Resonator β

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Barkhausen Condition

$$|A \cdot \beta(\omega_o)| = 1$$

$$A \cdot \beta(\omega_o) = 1$$

$$\arg[A \cdot \beta(\omega_o)] = 0$$

Introduction

Phase Noise

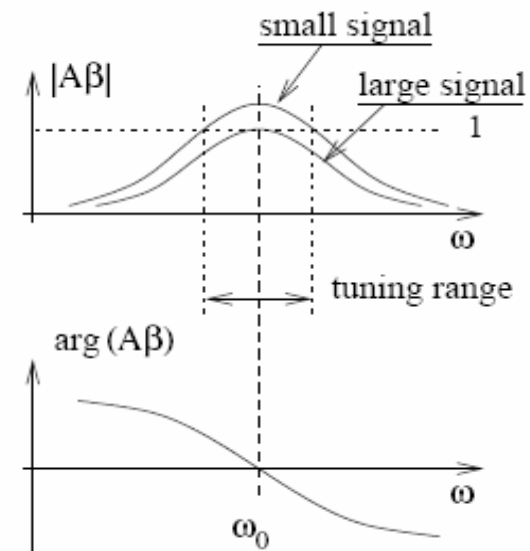

Jitter

Jitter Measurement

Conclusions

Oscillations

- Noise or switch-on transient
- Energy on ω_0 will rise exponential because $|A\beta| > 1$
- Amplitude is stabilized by automatic gain control or amplifier saturation

© E. Rubiola

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Tuning the Oscillator

- Static phase shift
 - Used mainly in microwave oscillators
- Change the natural frequency of the resonator
 - Used mainly in crystal oscillators

Introduction

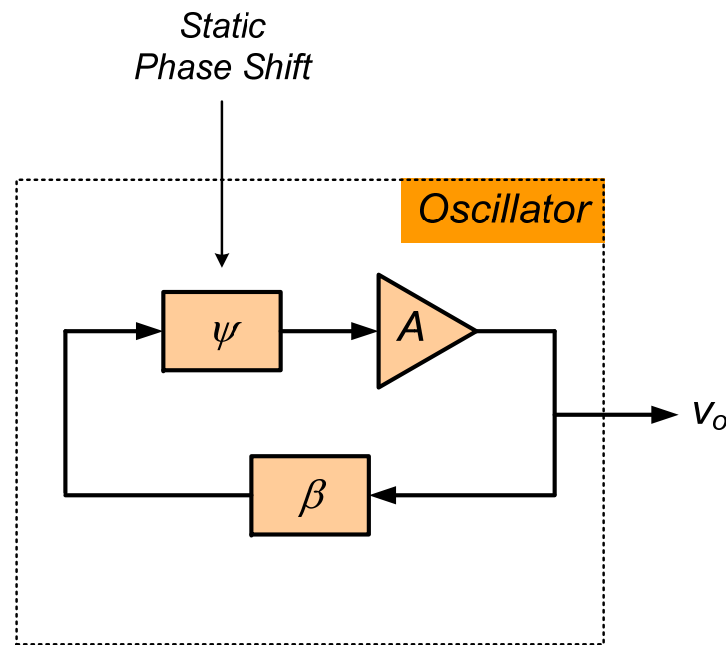

Phase Noise

Jitter

Jitter Measurement

Conclusions

Static Phase Shift

© E. Rubiola

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Static Phase Shift

$$\arg[A \cdot \beta(\omega)] + \psi = 0 \quad \text{at} \quad \omega = \omega_o + \Delta\omega$$

$$\Delta\omega \cdot \frac{d}{d\omega} \arg[A \cdot \beta(\omega)] \approx -\psi$$

$$\frac{d}{d\omega} \arg[A \cdot \beta(\omega)] \approx -\frac{2Q}{\omega_o} \quad \text{for a 2}^{\text{nd}} \text{ order resonator with large } Q$$

$$\frac{\Delta\omega}{\omega_o} = \frac{\psi}{2Q} \quad \text{for} \quad \frac{\Delta\omega}{\omega_o} = \frac{1}{2Q}$$

Jitter

Jitter Measurement

Conclusions

Analysis of the Oscillator

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Analysis of the Oscillator

- Phase Noise of Amplifier and other components (*Leeson Effect*)
 - Slow Fluctuations
 - Fast Fluctuations
- Amplifier Noise
 - Additive White Noise
 - Flicker Noise
- Resonator Noise
 - Additive White Noise
 - Flicker Frequency
 - Frequency Random Walk
- Buffer Amplifier Noise
 - Additive White Noise
 - Flicker Noise

Introduction

Phase Noise

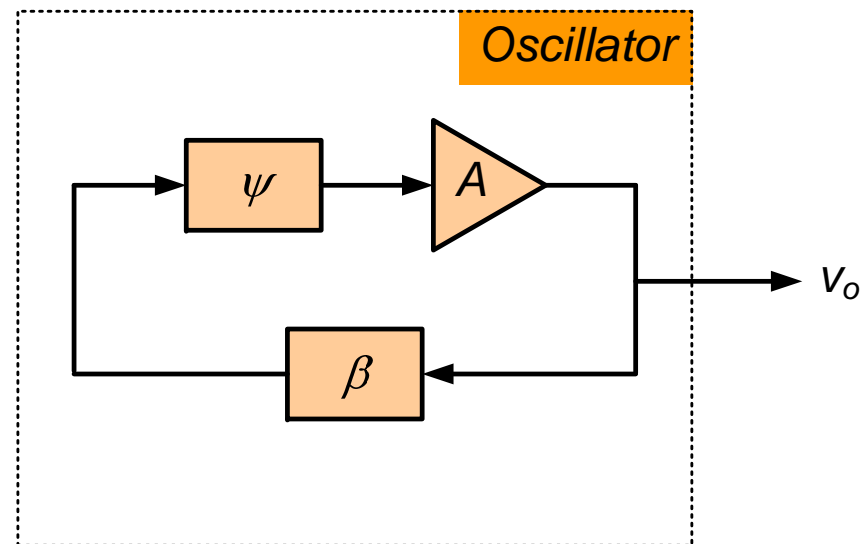

Jitter

Jitter Measurement

Conclusions

Leeson Formula

- Consider an ideal resonator
 - No frequency fluctuations
 - Large quality factor Q
- Account all phase noise sources by ψ

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Quasi-static Perturbation

- The slow components of φ , that is, slower than the relaxation time τ , can be treated as stationary

$$\tau = \frac{2Q}{\omega_o} \rightarrow \text{relaxation time}$$

$$\Delta f = \frac{f_o}{2Q} \varphi(t)$$

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Spectral Density of Frequency Deviations

$$\Delta f = \frac{f_o}{2Q} \varphi(t)$$

$$S_{\Delta f}(f) = \left(\frac{f_o}{2Q} \right)^2 S_{\varphi}(f)$$

*Introduction**Phase Noise**Jitter**Jitter Measurement**Conclusions*

Spectral Density of Phase Noise

$$\varphi(t) = 2\pi \int \Delta f(t) \cdot dt$$

Integration in the time domain corresponds to division by $j\omega$ in the frequency domain

Division by $j\omega$ in the frequency domain corresponds to division by $(j\omega)^2$ in the spectrum

$$S_{\varphi}(f) = \frac{1}{f^2} \left(\frac{f_o}{2Q} \right)^2 S_{\psi}(f)$$

Introduction

Phase Noise

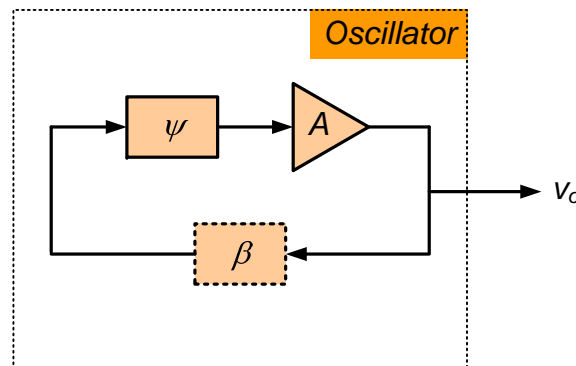

Jitter

Jitter Measurement

Conclusions

Fast Fluctuations

- The fast components of φ , that is, faster than the relaxation time τ , the resonator can be treated as an open circuit
- The output noise is not fed back

$$S_{\varphi}(f) = S_{\psi}(f)$$

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Slow and Fast Fluctuations

$$\text{Slow Fluctuations} \rightarrow S_{\varphi}(f) = \frac{1}{f^2} \left(\frac{f_o}{2Q} \right)^2 S_{\psi}(f)$$

$$\text{Fast Fluctuations} \rightarrow S_{\varphi}(f) = S_{\psi}(f)$$

$$S_{\varphi}(f) = \left[1 + \frac{1}{f^2} \left(\frac{f_o}{2Q} \right)^2 \right] S_{\psi}(f)$$

Introduction

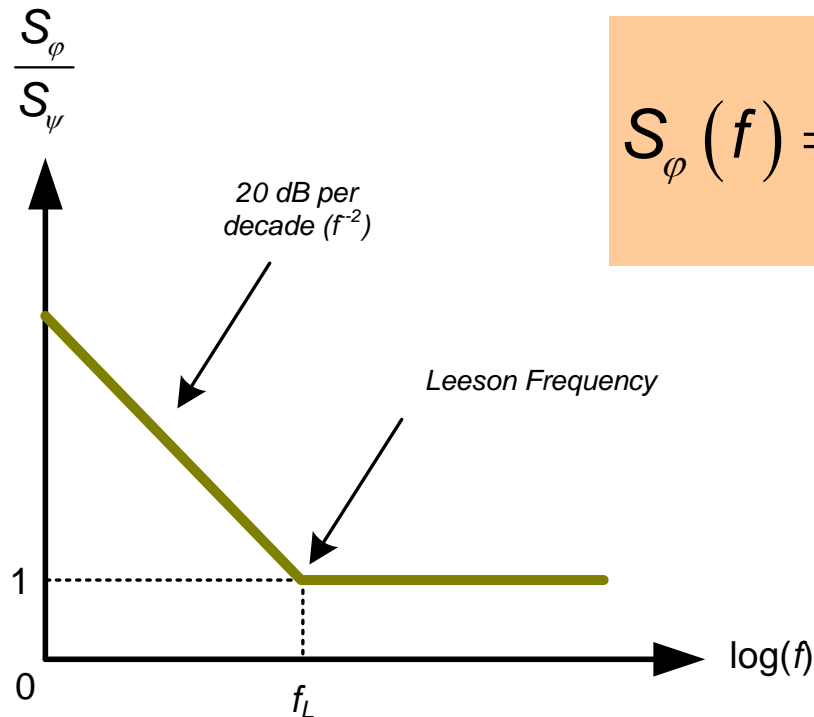

Phase Noise

Jitter

Jitter Measurement

Conclusions

Leeson Formula

$$S_\phi(f) = \left[1 + \left(\frac{f_L}{f} \right)^2 \right] S_\psi(f)$$

$$f_L = \frac{f_o}{2Q}$$

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Amplifier Analysis

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Additive White Noise in the Amplifier

- White Noise has a constant Power Density
- It depends on the
 - Noise Figure F
 - Carrier power P_0
 - Ambient temperature T_0 (290 K)
 - Boltzman Constant k ($1.3806503 \times 10^{-23}$ J/K)

$$S_{\varphi}(f) = \frac{FkT_0}{P_0}$$

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Flicker Noise in the Amplifier

$$S_\varphi(f) \propto \frac{1}{f}$$

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Unconverted Flicker Noise

$$x(t) = V_0 \cos(\omega_0 t) + n(t) \quad f(x) = a_0 + a_1 x + a_2 x^2$$

$$y(t) = f(x(t)) = a_0 + a_1 V_0 \cos(\omega_0 t) + a_1 n(t) + \\ + a_2 V_0^2 \cos^2(\omega_0 t) + a_2 n(t) + a_2 V_0 n(t) \cos(\omega_0 t)$$

Introduction

Phase Noise

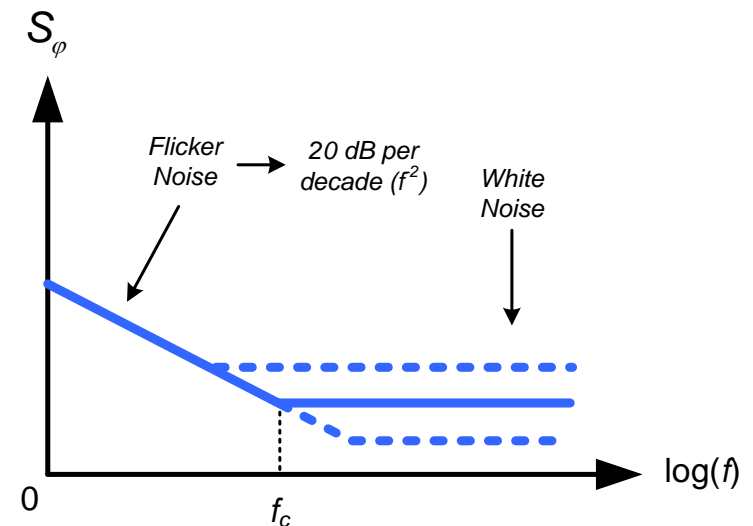

Jitter

Jitter Measurement

Conclusions

Phase Noise of the Amplifier

- White Noise and Flicker Noise are independent
- White Noise is inversely proportional to carrier power
- Flicker Noise is independent of carrier power

Introduction

Phase Noise

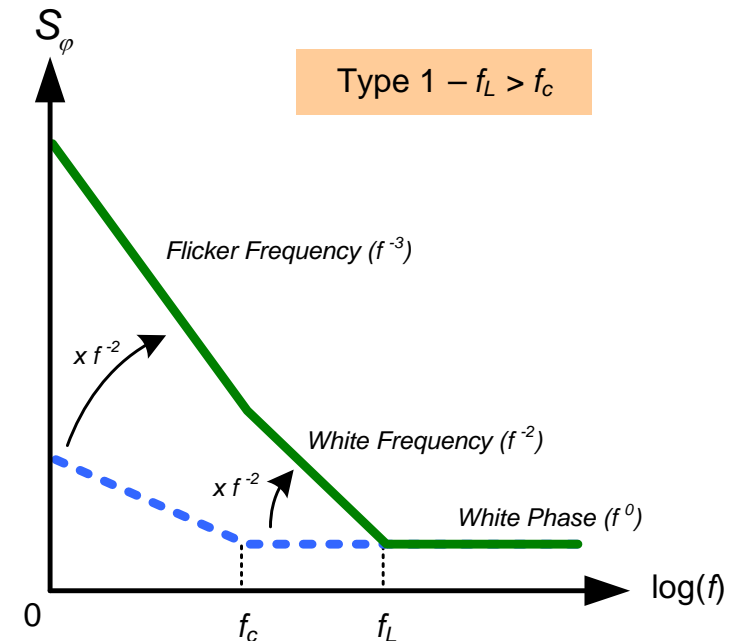

Jitter

Jitter Measurement

Conclusions

Amplifier + Leeson (Type 1)

- Typical of
 - Microwave oscillators
 - High frequency piezoelectric oscillators (>100 MHz)
- f_L is high because
 - High resonant frequency
 - Low Q

Introduction

Phase Noise

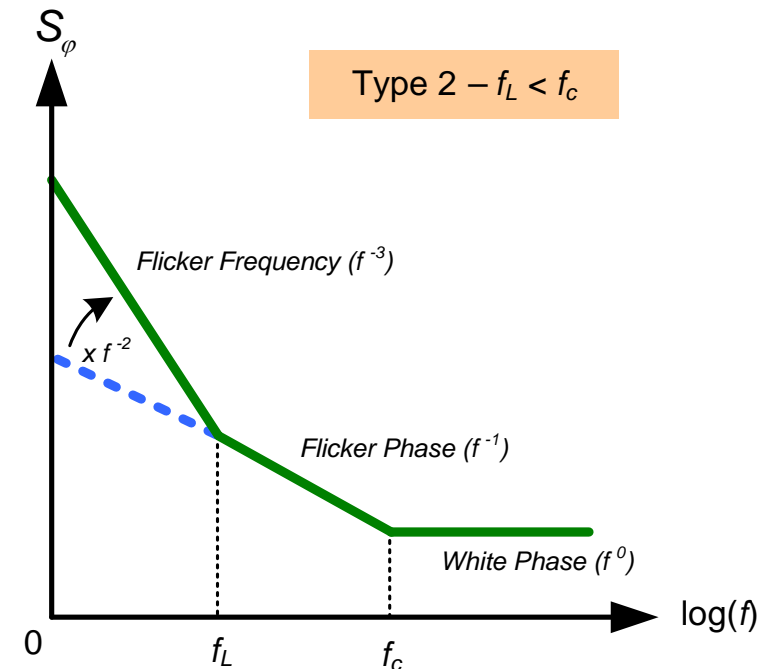

Jitter

Jitter Measurement

Conclusions

Amplifier + Leeson (Type 2)

- Low frequency (5 to 10 MHz), high stability quartz oscillators
- f_L is low due to high Q ($> 10^6$)

Introduction

Phase Noise

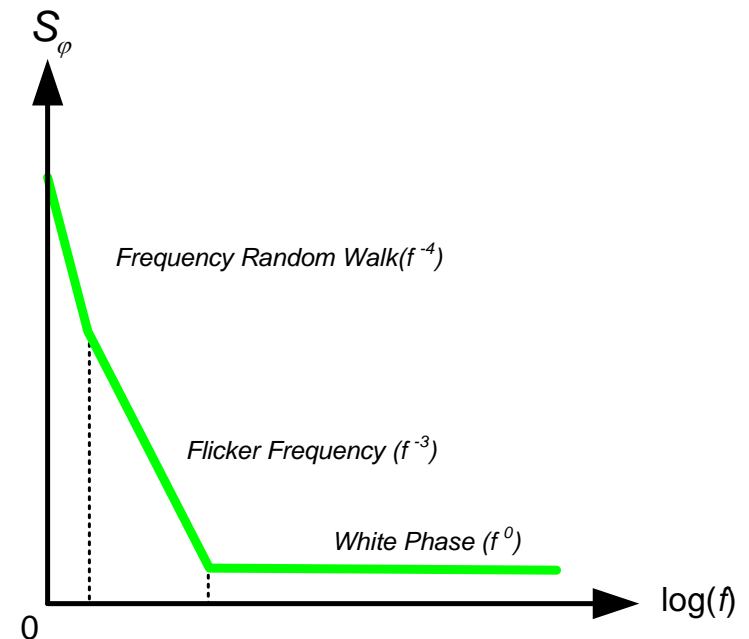

Jitter

Jitter Measurement

Conclusions

Resonator Noise

- Types of noise present
 - White noise (not significant)
 - Flicker frequency
 - Frequency Random Walk

Introduction

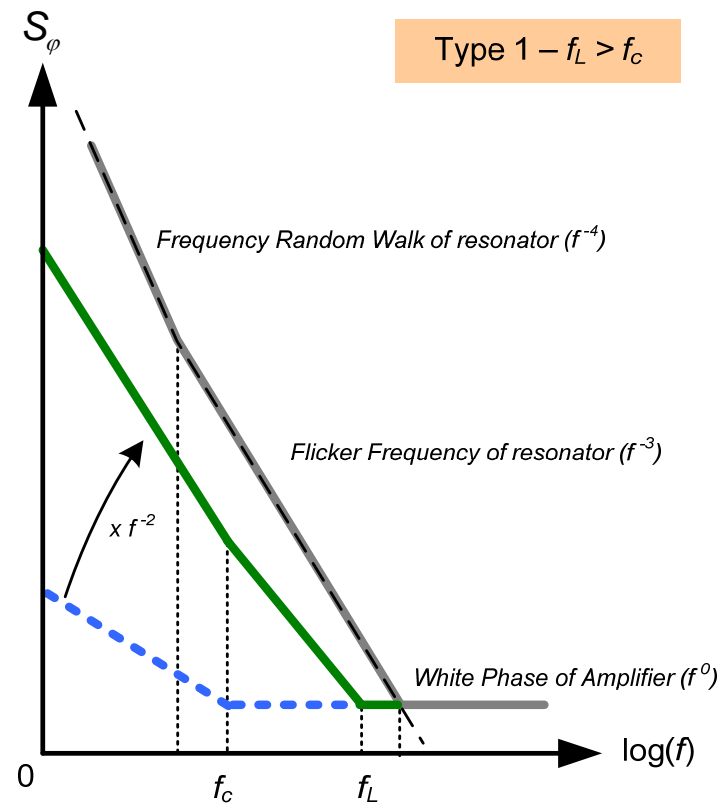

Phase Noise

Jitter

Jitter Measurement

Conclusions

Effect of Resonator Noise (Type 1)

Introduction

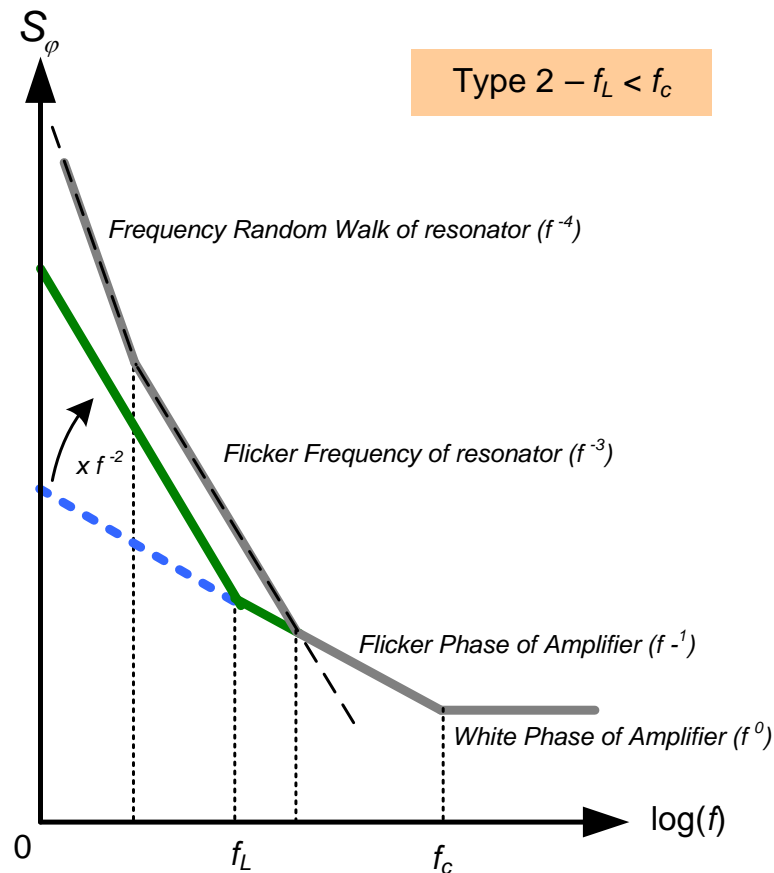

Phase Noise

Jitter

Jitter Measurement

Conclusions

Effect of Resonator Noise (Type 2)

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Buffer Amplifier

- White Noise
- Flicker Noise

Introduction

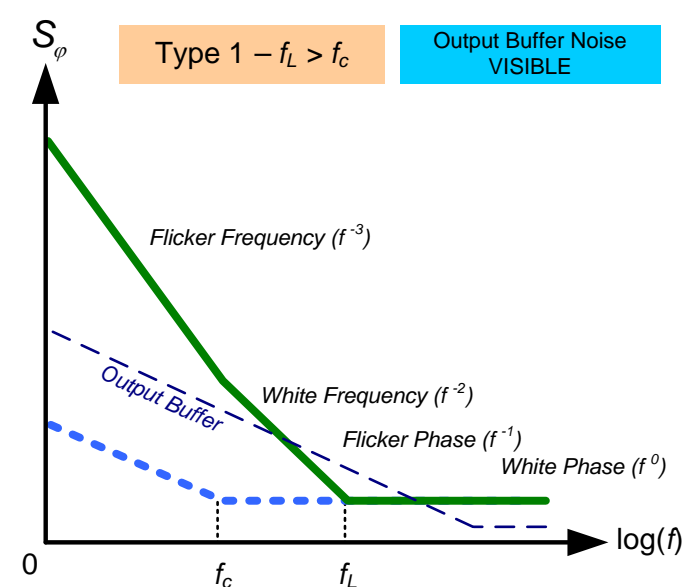

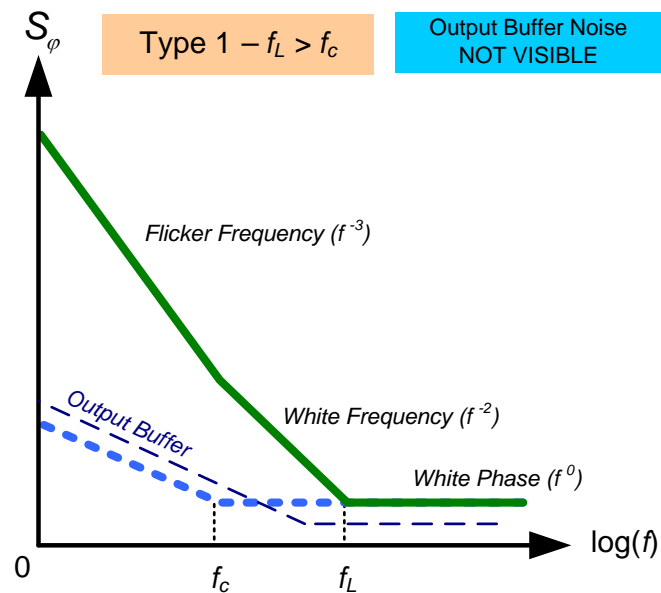

Phase Noise

Jitter

Jitter Measurement

Conclusions

Effect of Buffer Amplifier Noise on Type 1

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Effect of Buffer Amplifier Noise on Type 2

Phase Noise

Relaxation Oscillator

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Relaxation Oscillator

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Oscillation Frequency

- Frequency Modulation due to:
 - Noise in the charging current
 - Noise on the reference voltages

$$f_c = \frac{I}{2C\Delta V_t}$$

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Phase Noise Spectrum

$$S_{\phi}(f) = \frac{1}{I^2} \left(\frac{f_c}{f} \right)^2 S_{i_n}(f) \qquad S_{\phi}(f) = \frac{1}{(\Delta v_t)^2} \left(\frac{f_c}{f} \right)^2 S_{v_n}(f)$$

- Flicker noise in I or Δv_t will appear as f^{-3} phase noise

Jitter

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

What is Jitter

$$v(t) = A \cdot \cos[2\pi \cdot f_c \cdot t + \varphi(t)] \quad v(t) = A \cdot \cos[2\pi \cdot f_c \cdot (t + j(t))]$$

$$j(t) = \frac{\varphi(t)}{2\pi \cdot f_c}$$

Introduction

Phase Noise

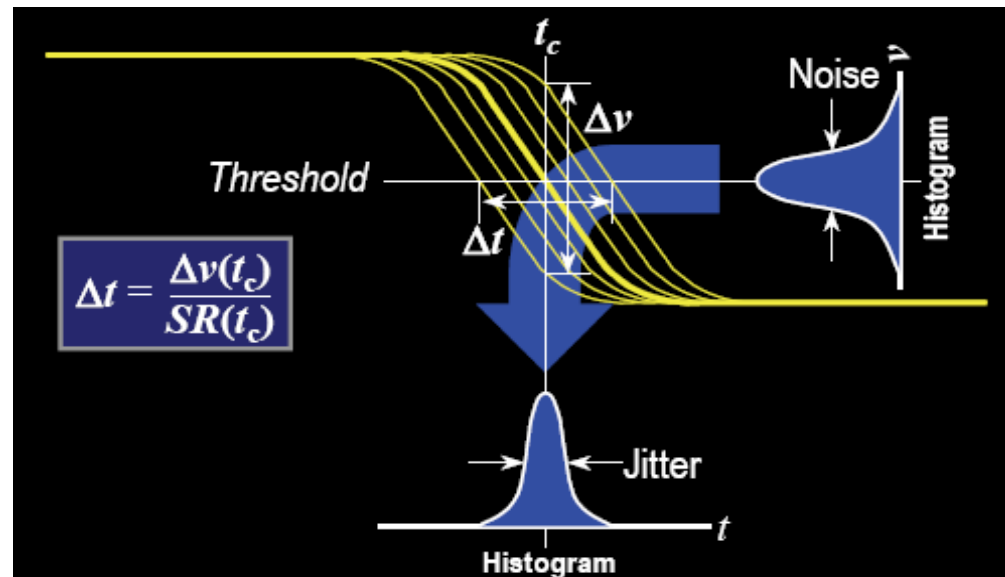

Jitter

Jitter Measurement

Conclusions

What Causes Jitter?

- Phase Noise
- Voltage Noise + Threshold

© Cadence

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Relating Phase Noise and Jitter

$$j(t) = \frac{\varphi(t)}{2\pi \cdot f_c} \qquad \mathcal{L}(f) = 10 \cdot \log \left[\frac{1}{2} S_\varphi(f) \right]$$

$$\sigma_t = \sqrt{\frac{1}{T} \int_0^T j^2(t) dt} = \sqrt{\frac{1}{T} \int_0^T \left(\frac{\varphi(t)}{2\pi f_c} \right)^2 dt} = \frac{1}{2\pi f_c} \sqrt{\int_{f_1}^{f_2} S(f) df}$$

$$\sigma_t = \frac{1}{2\pi f_c} \sqrt{2 \int_{f_1}^{f_2} 10^{\frac{\mathcal{L}(f)}{10}} \cdot df}$$

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Relating Phase Noise and Jitter

$$\sigma_t = \frac{1}{2\pi f_c} \sqrt{2 \int_{f_1}^{f_2} 10^{\frac{\mathcal{L}(f)}{10}} \cdot df}$$

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Effects of Jitter

- Increase in system noise
- Uncertainty in the actual phase of the sample
- Intersymbol interference

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Increase in System Noise

$$v(t) = A \cdot \sin(2\pi \cdot f \cdot t)$$

$$\frac{d}{dt}v(t) = 2\pi \cdot f \cdot A \cdot \cos(2\pi \cdot f \cdot t)$$

$$\left. \frac{d}{dt}v(t) \right|_{\max} = 2\pi \cdot f \cdot A \rightarrow \text{maximum slew rate}$$

$$v(t) = A \cdot \cos(2\pi f \cdot t)$$

$$\left| \frac{d}{dt} v(t) \right| = 2\pi \cdot f \cdot A \cdot \sin(2\pi \cdot f \cdot t)$$

$$\left| \frac{d}{dt} v(t) \right|_{v(t)=0} = 2\pi \cdot f \cdot A$$

$$\sigma_t = \frac{\sigma_v}{2\pi f A}$$

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Input Frequency Choice

- Input frequency has to be a multiple of clock frequency
- Input frequency should be as high as possible
- High input frequencies will induce nonlinearities in the ADC

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Problems

- Phase delay is needed for the sample clock but it is not accurate enough
- Voltage noise is measured together with jitter
- Differential phase noise between synthesizers is included in the result

Introduction

Jitter

Jitter Measurement

Conclusions

Double Beat Frequency Method

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Double Beat Frequency Method

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Advantages

- Eliminates the signal and systematic errors
 - Differential Non Linearity
 - Quantization Noise

Introduction

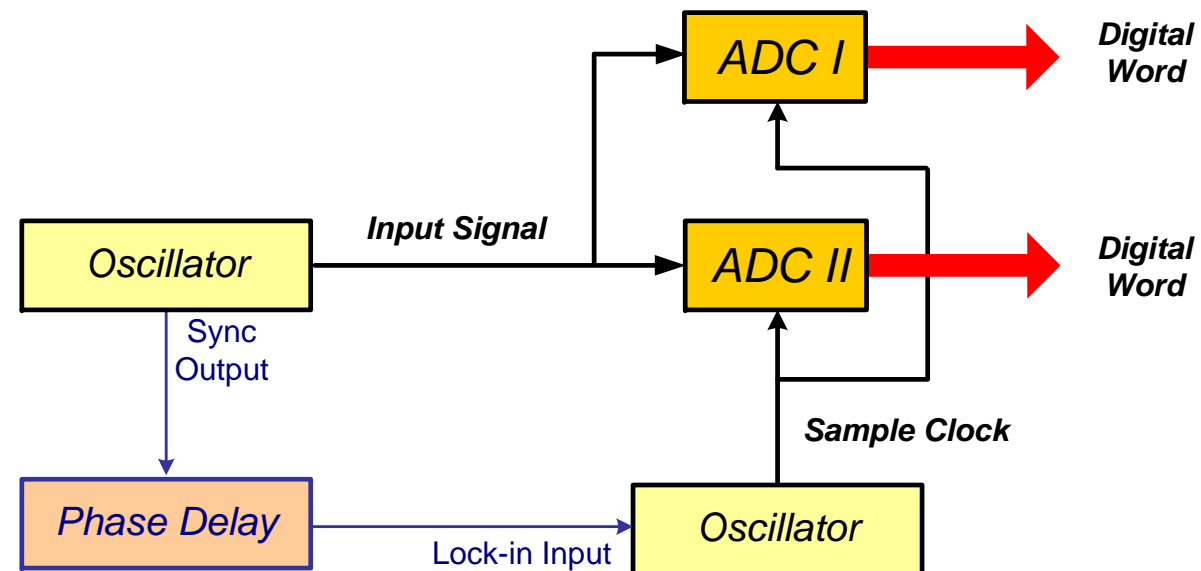

Phase Noise

Jitter

Jitter Measurement

Conclusions

Removing Differential Phase Noise

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Procedure

- Subtract the Amplitude Noise obtained in each ADC
- We get the RMS noise of each ADC quadratically added (power added)

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Separating Amplitude Noise and Jitter induced Voltage Noise

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

From Voltage Noise to Jitter

- Divide by the signal slope
- Filter signal and keep 5 harmonics to estimate signal slope

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Separating The Jitter From Both ADCs

- Use 3 identical ADCs
- Use 2 at a time – 3 Combinations
- From the 3 measurements (σ_{t12} , σ_{t13} and σ_{t23}) compute the jitter of each ADC

$$\sigma_{t12}^2 = \sigma_{t1}^2 + \sigma_{t2}^2$$

$$\sigma_{t13}^2 = \sigma_{t1}^2 + \sigma_{t3}^2$$

$$\sigma_{t23}^2 = \sigma_{t2}^2 + \sigma_{t3}^2$$

Fitting

$$\sigma_v^2 = \sigma_t^2 \left| \frac{d}{dt} v(t) \right|^2 + \sigma_n^2 = \sigma_j^2 \omega^2 A^2 \sin^2(\omega t) + \sigma_n^2$$

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Jitter from SNR

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Effect of Jitter on the RMS Voltage of a Sine Wave Residuals

$$\sigma_v = \left. \frac{dv}{dt} \right|_{rms} \cdot \sigma_t = \sqrt{\frac{1}{T} \int_0^T \left(\frac{dv(t)}{dt} \right)^2 dt} \cdot \sigma_t$$

$$\sigma_v = \sqrt{2\pi f A} \sigma_t$$

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Influence of Jitter on SNR

$$SNR = 20 \log \left(\frac{\frac{A}{\sqrt{2}}}{\sqrt{(\sqrt{2}\pi Af)^2 \sigma_t^2 + \sigma_n^2}} \right)$$

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

SNR

- Changing the input frequency will change the contribution of jitter to SNR
- Changing the sine wave amplitude will change the contribution of amplitude noise

$$SNR = -20 \log \sqrt{(2\pi f)^2 \sigma_t^2 + 2 \frac{\sigma_n^2}{A^2}}$$

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Different Jitter Sources

- ADC sampling
- Input signal
- Sample clock

$$\sigma_t^2 = \sigma_S^2 + \sigma_{SIG}^2 + \sigma_{CLK}^2$$

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Separating Jitter Sources

- Input signal jitter depends on the input signal amplitude
- Clock signal depends on clock frequency

$$\sigma_t^2 = \sigma_S^2 + \frac{f_{SIG0}^2}{f_{SIG}^2} \sigma_{SIG0}^2 + \frac{f_{CLK0}^2}{f_{CLK}^2} \sigma_{CLK0}^2$$

Introduction

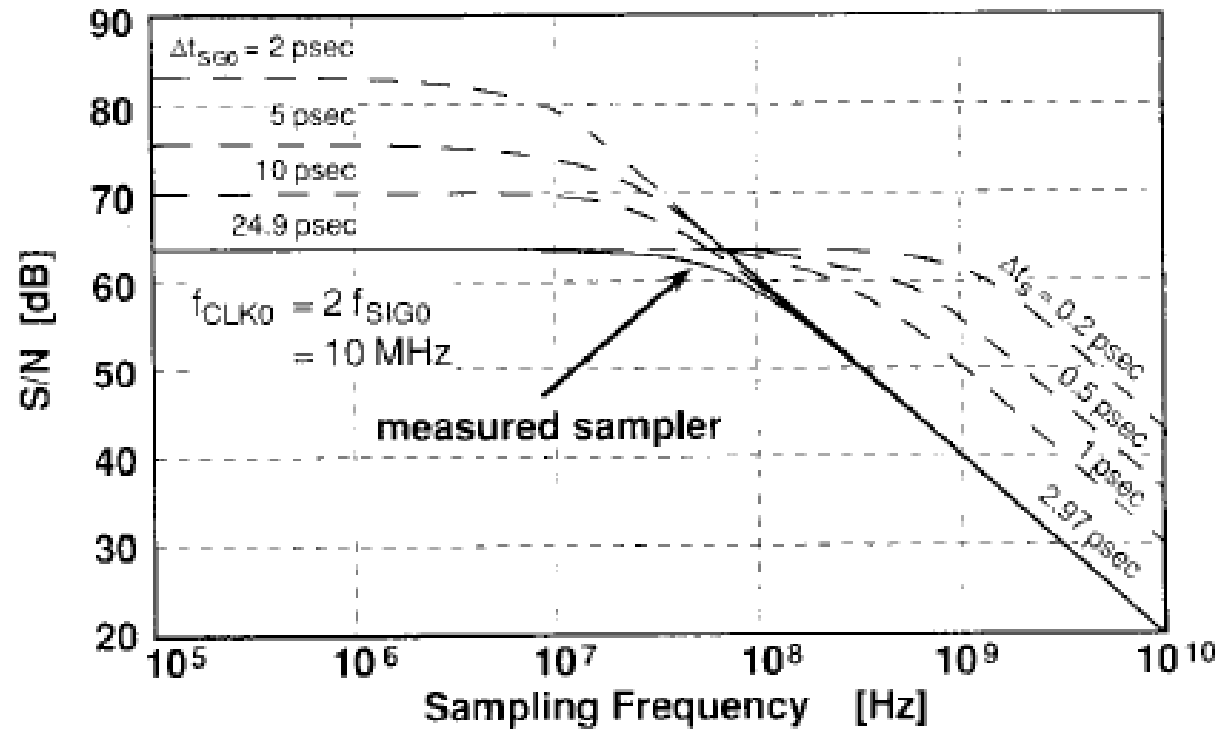

Phase Noise

Jitter

Jitter Measurement

Distinguishing Jitter Source

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Jitter Source Test

- Repeat the test for 3 different sets of input and clock frequency

f_{CLK} [MHz]	f_{SIG} [MHz]	Δt [psec]
20	40	4.99
20	20	7.26
10	40	6.74

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

IEEE Std 1057

- Large sine wave
- Asynchronous triggering
- Sinefitting
- Divide residuals by signal derivative (remove low derivative values)
- Collect 10 records
- Average them point by point to eliminate
 - Amplitude noise
 - Quantization noise
 - Harmonic distortion

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

IEEE Std 1057

- Compute the mean of all points
- The difference of the errors from the mean are the fixed errors in sample time
- The standard deviation is the aperture uncertainty

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

IEEE Std 1057 – Alternate Method

- Acquire two records at different frequencies
- Calculate RMS error from residuals of sine fitting
- Calculate jitter:

$$\sigma_t = \frac{\sqrt{\sigma_B^2 - \sigma_A^2}}{\sqrt{2\pi} A f_B}$$

Introduction

Phase Noise

Jitter

Jitter Measurement

Conclusions

Conclusion

- Phase noise depends on the oscillator used
- Jitter is caused by phase noise (in the time domain) and by sampling circuits
- Jitter and its sources are measured by taking into account the influence of frequency and amplitude of the signals used
